

Metagenomic Analysis of Heat-Disturbed Soil Microbial Community

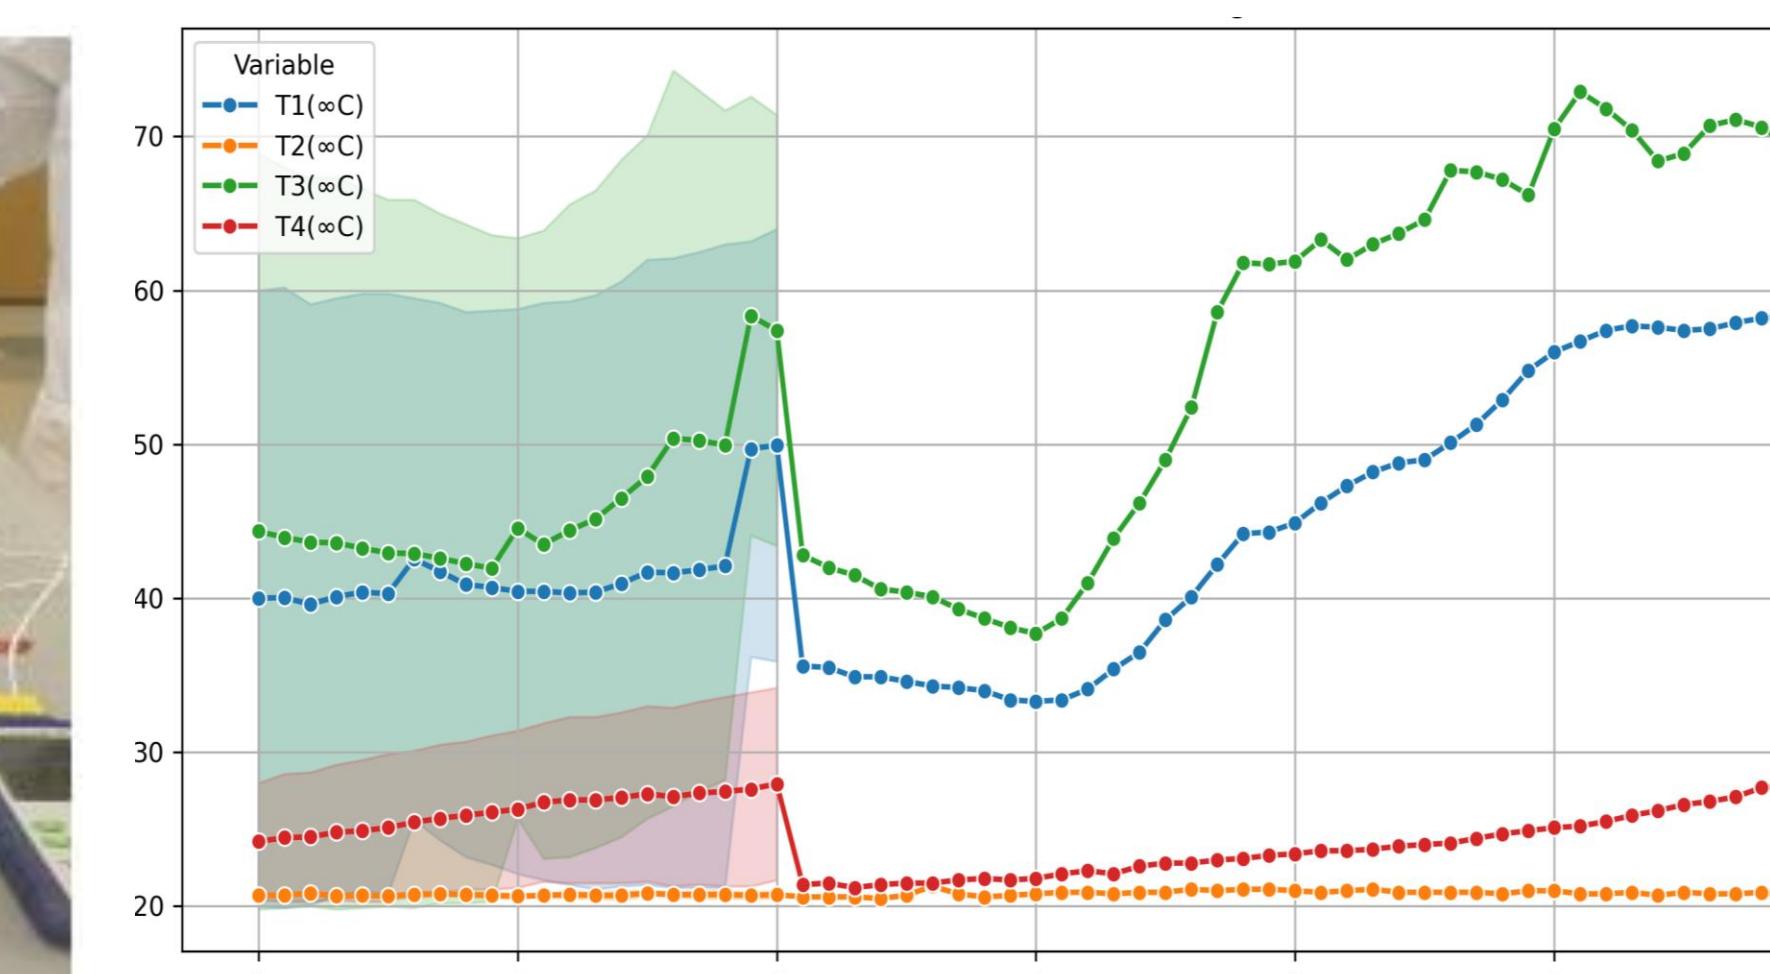

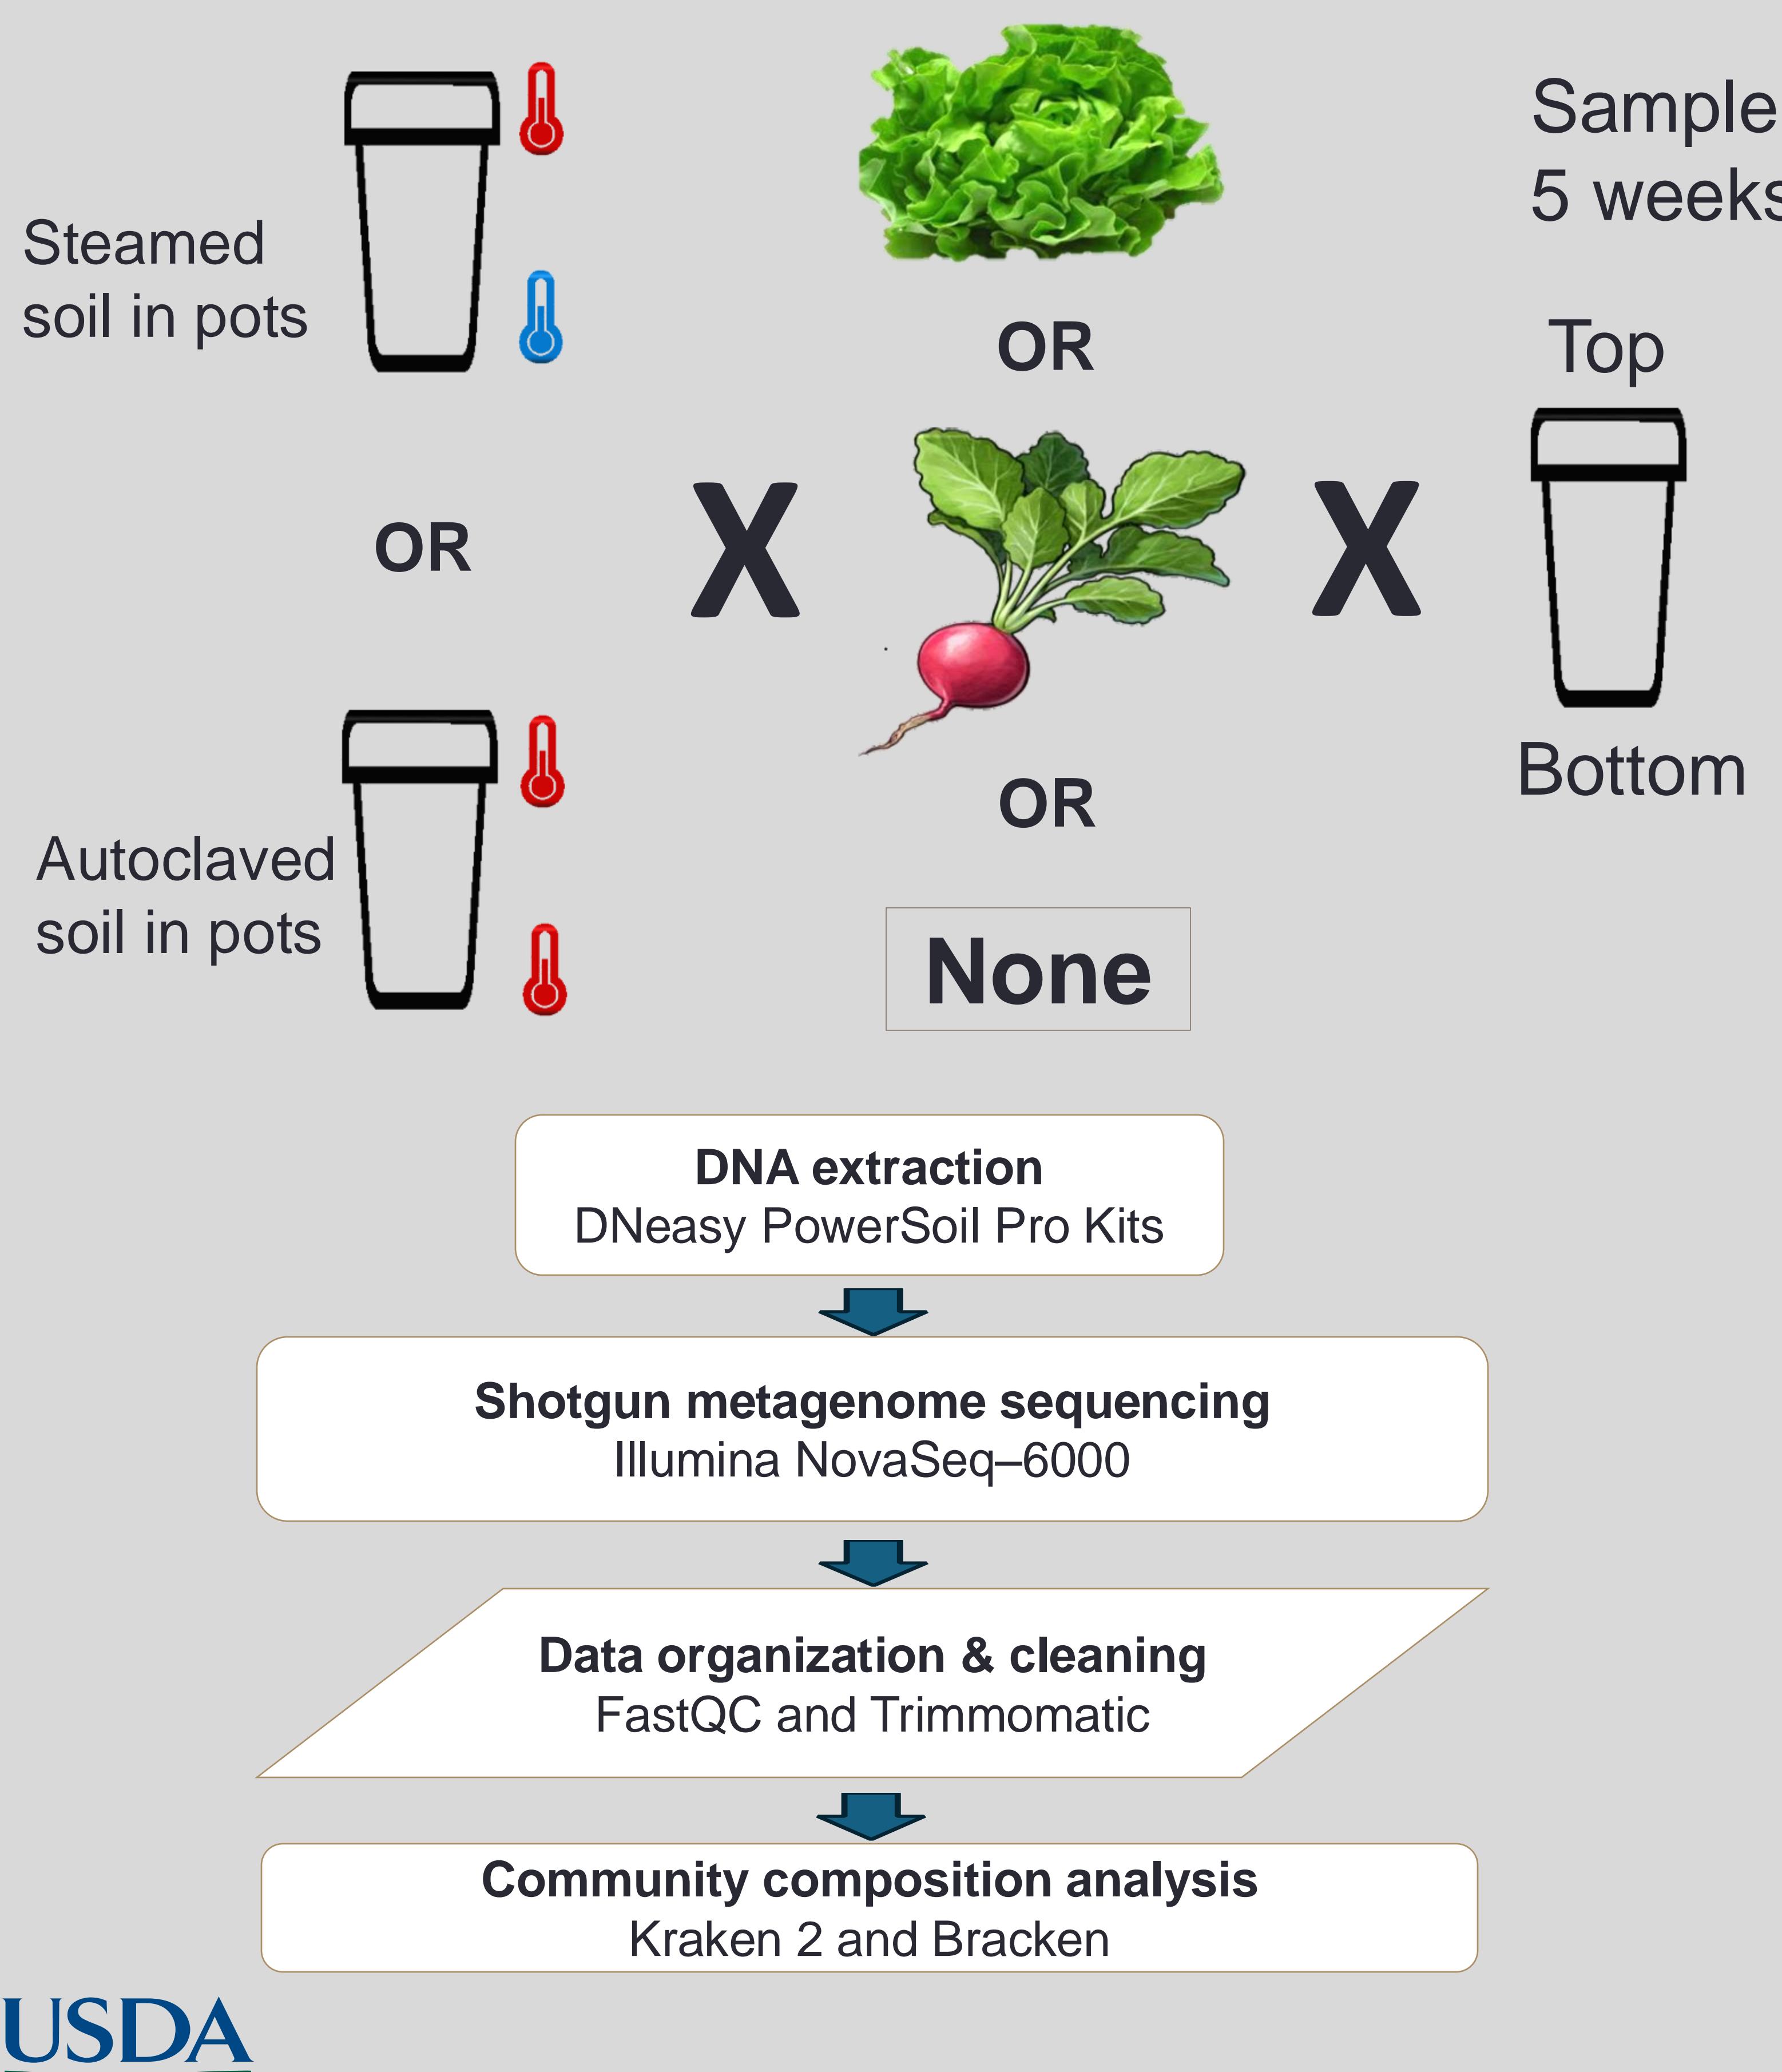

Admas Berisso¹ and Anna O'Brien¹

¹Department of Molecular, Cellular and Biomedical Sciences, University of New Hampshire

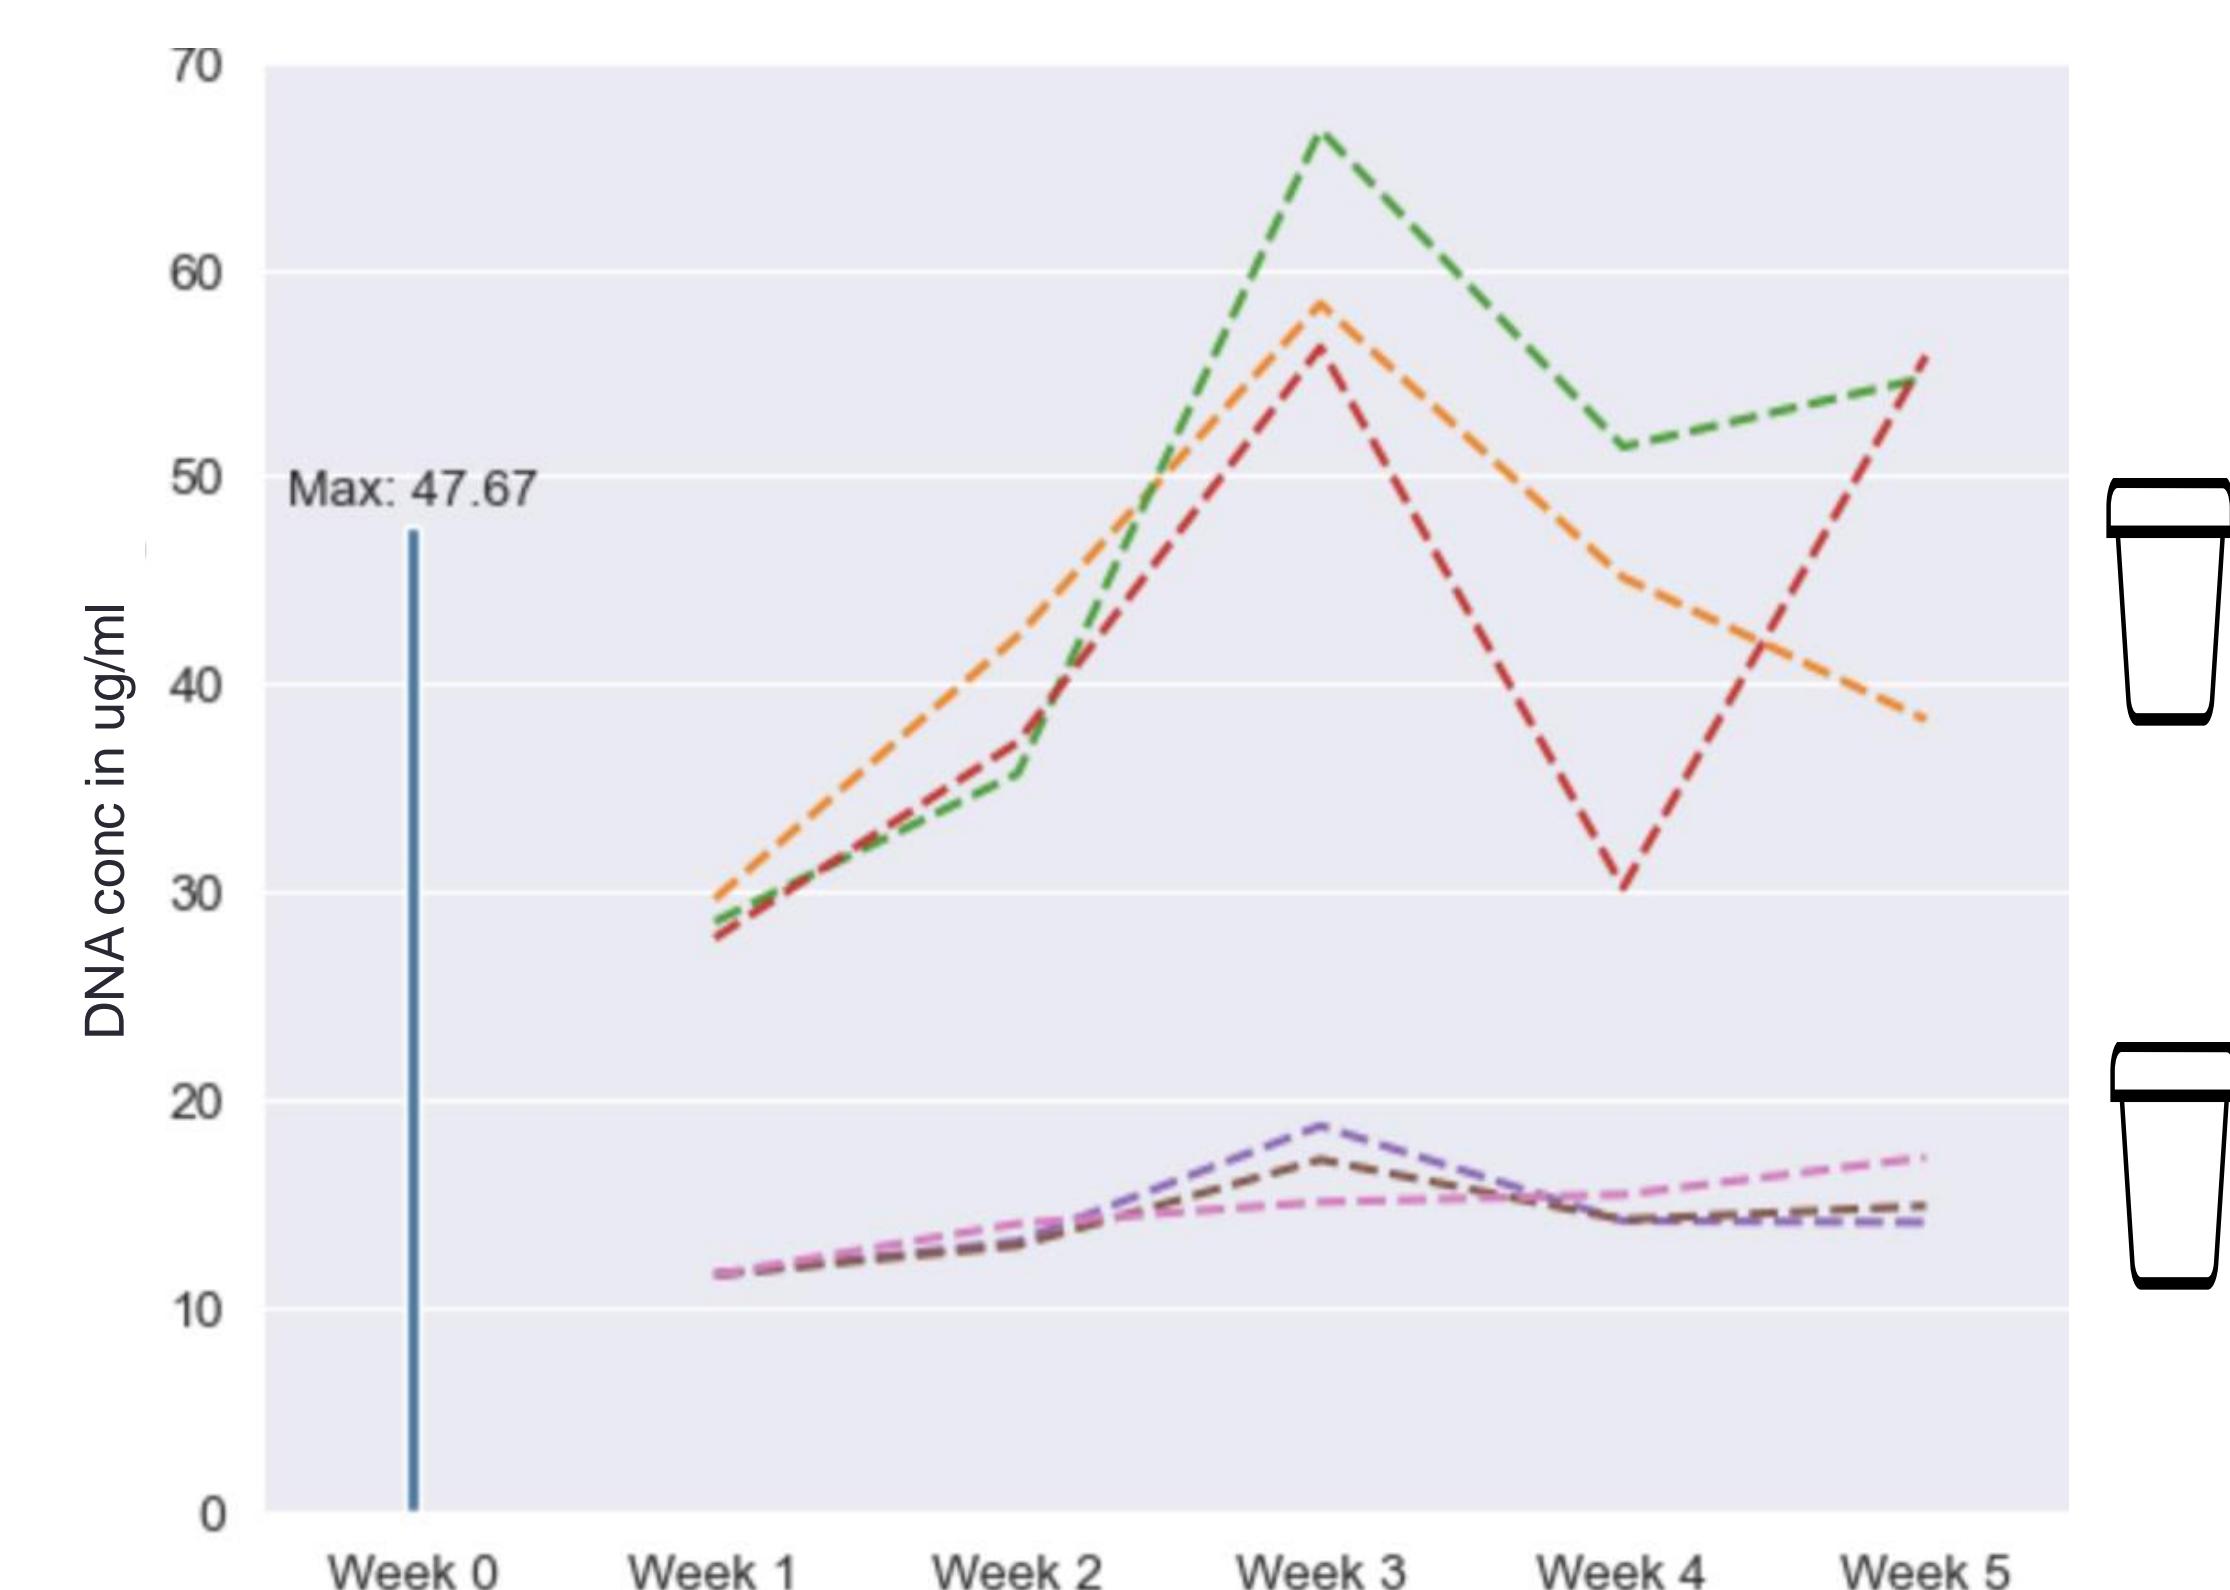

- Crops provide 82% of the global calorie supply.
- Soil microbes affect crop production and include both beneficial and pathogens.
- Heat treatments, including steaming, are popular for pests and disease control and can alter soil microbiomes.
- Planting after heat may alter microbiome recovery, as plants affect microbial colonization.

Do hosts alter the recovery of heat-disturbed microbiomes?

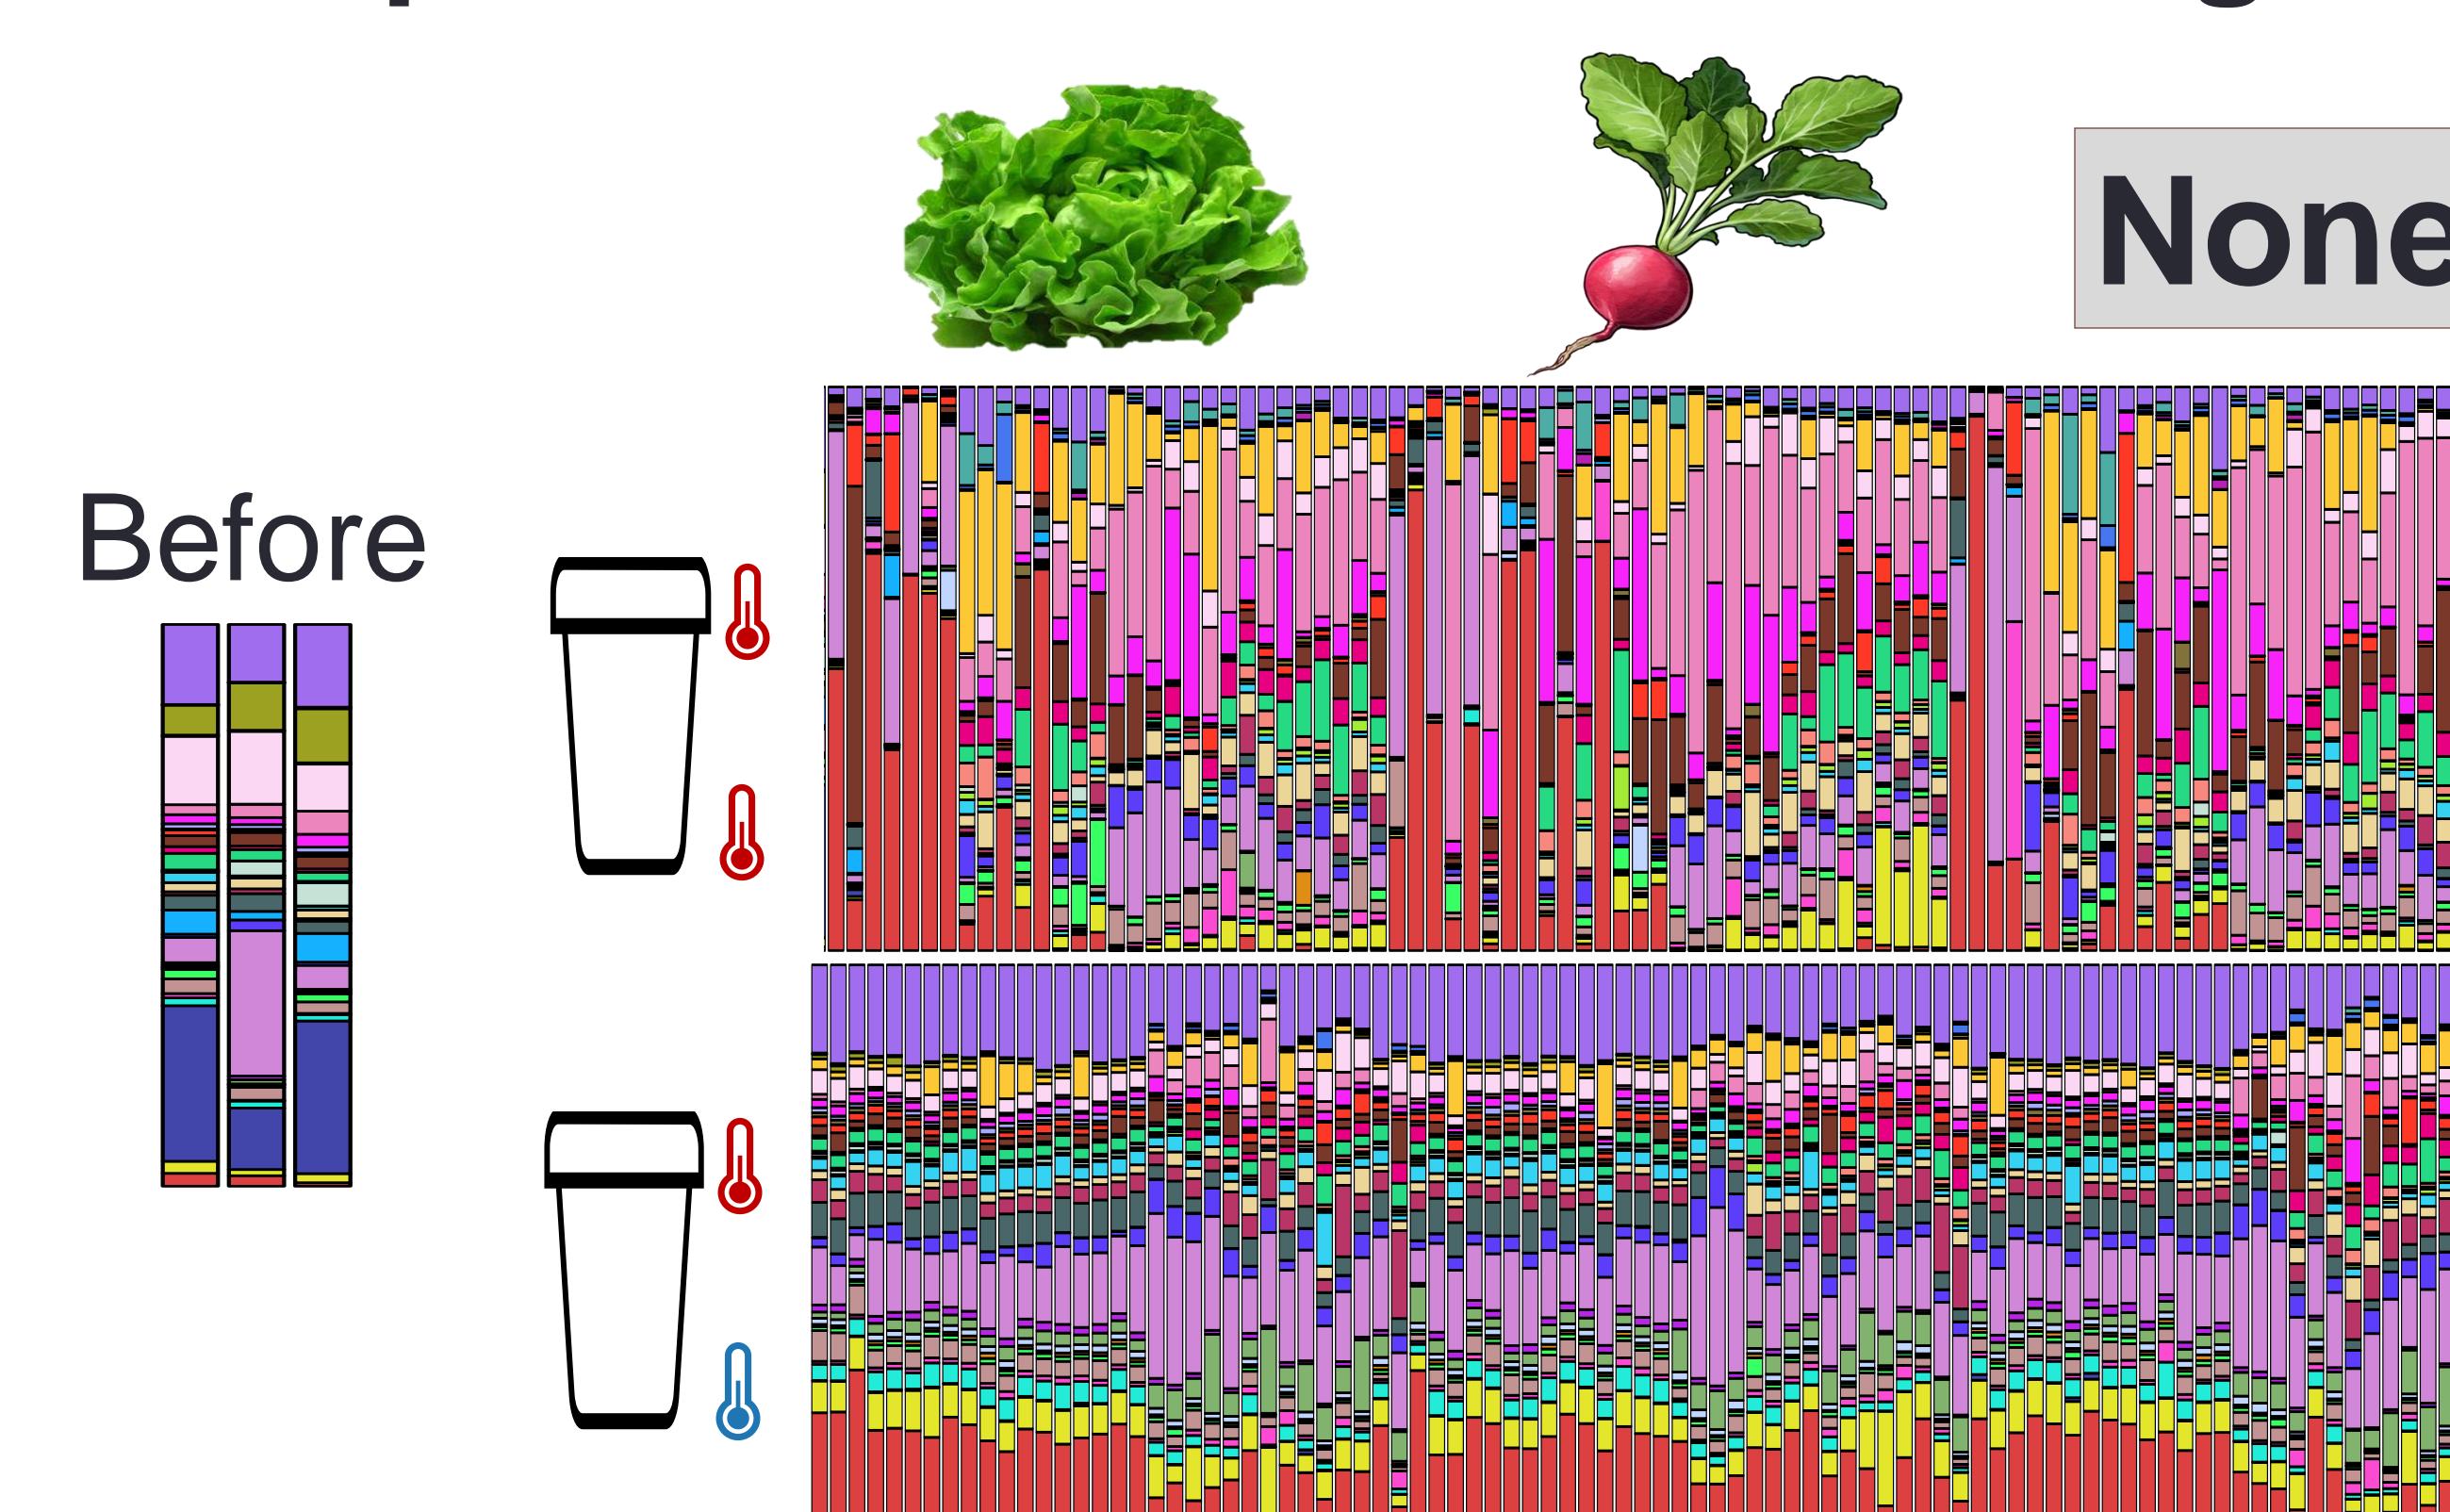

Pot **top** is hot but **bottom** is cool during steaming

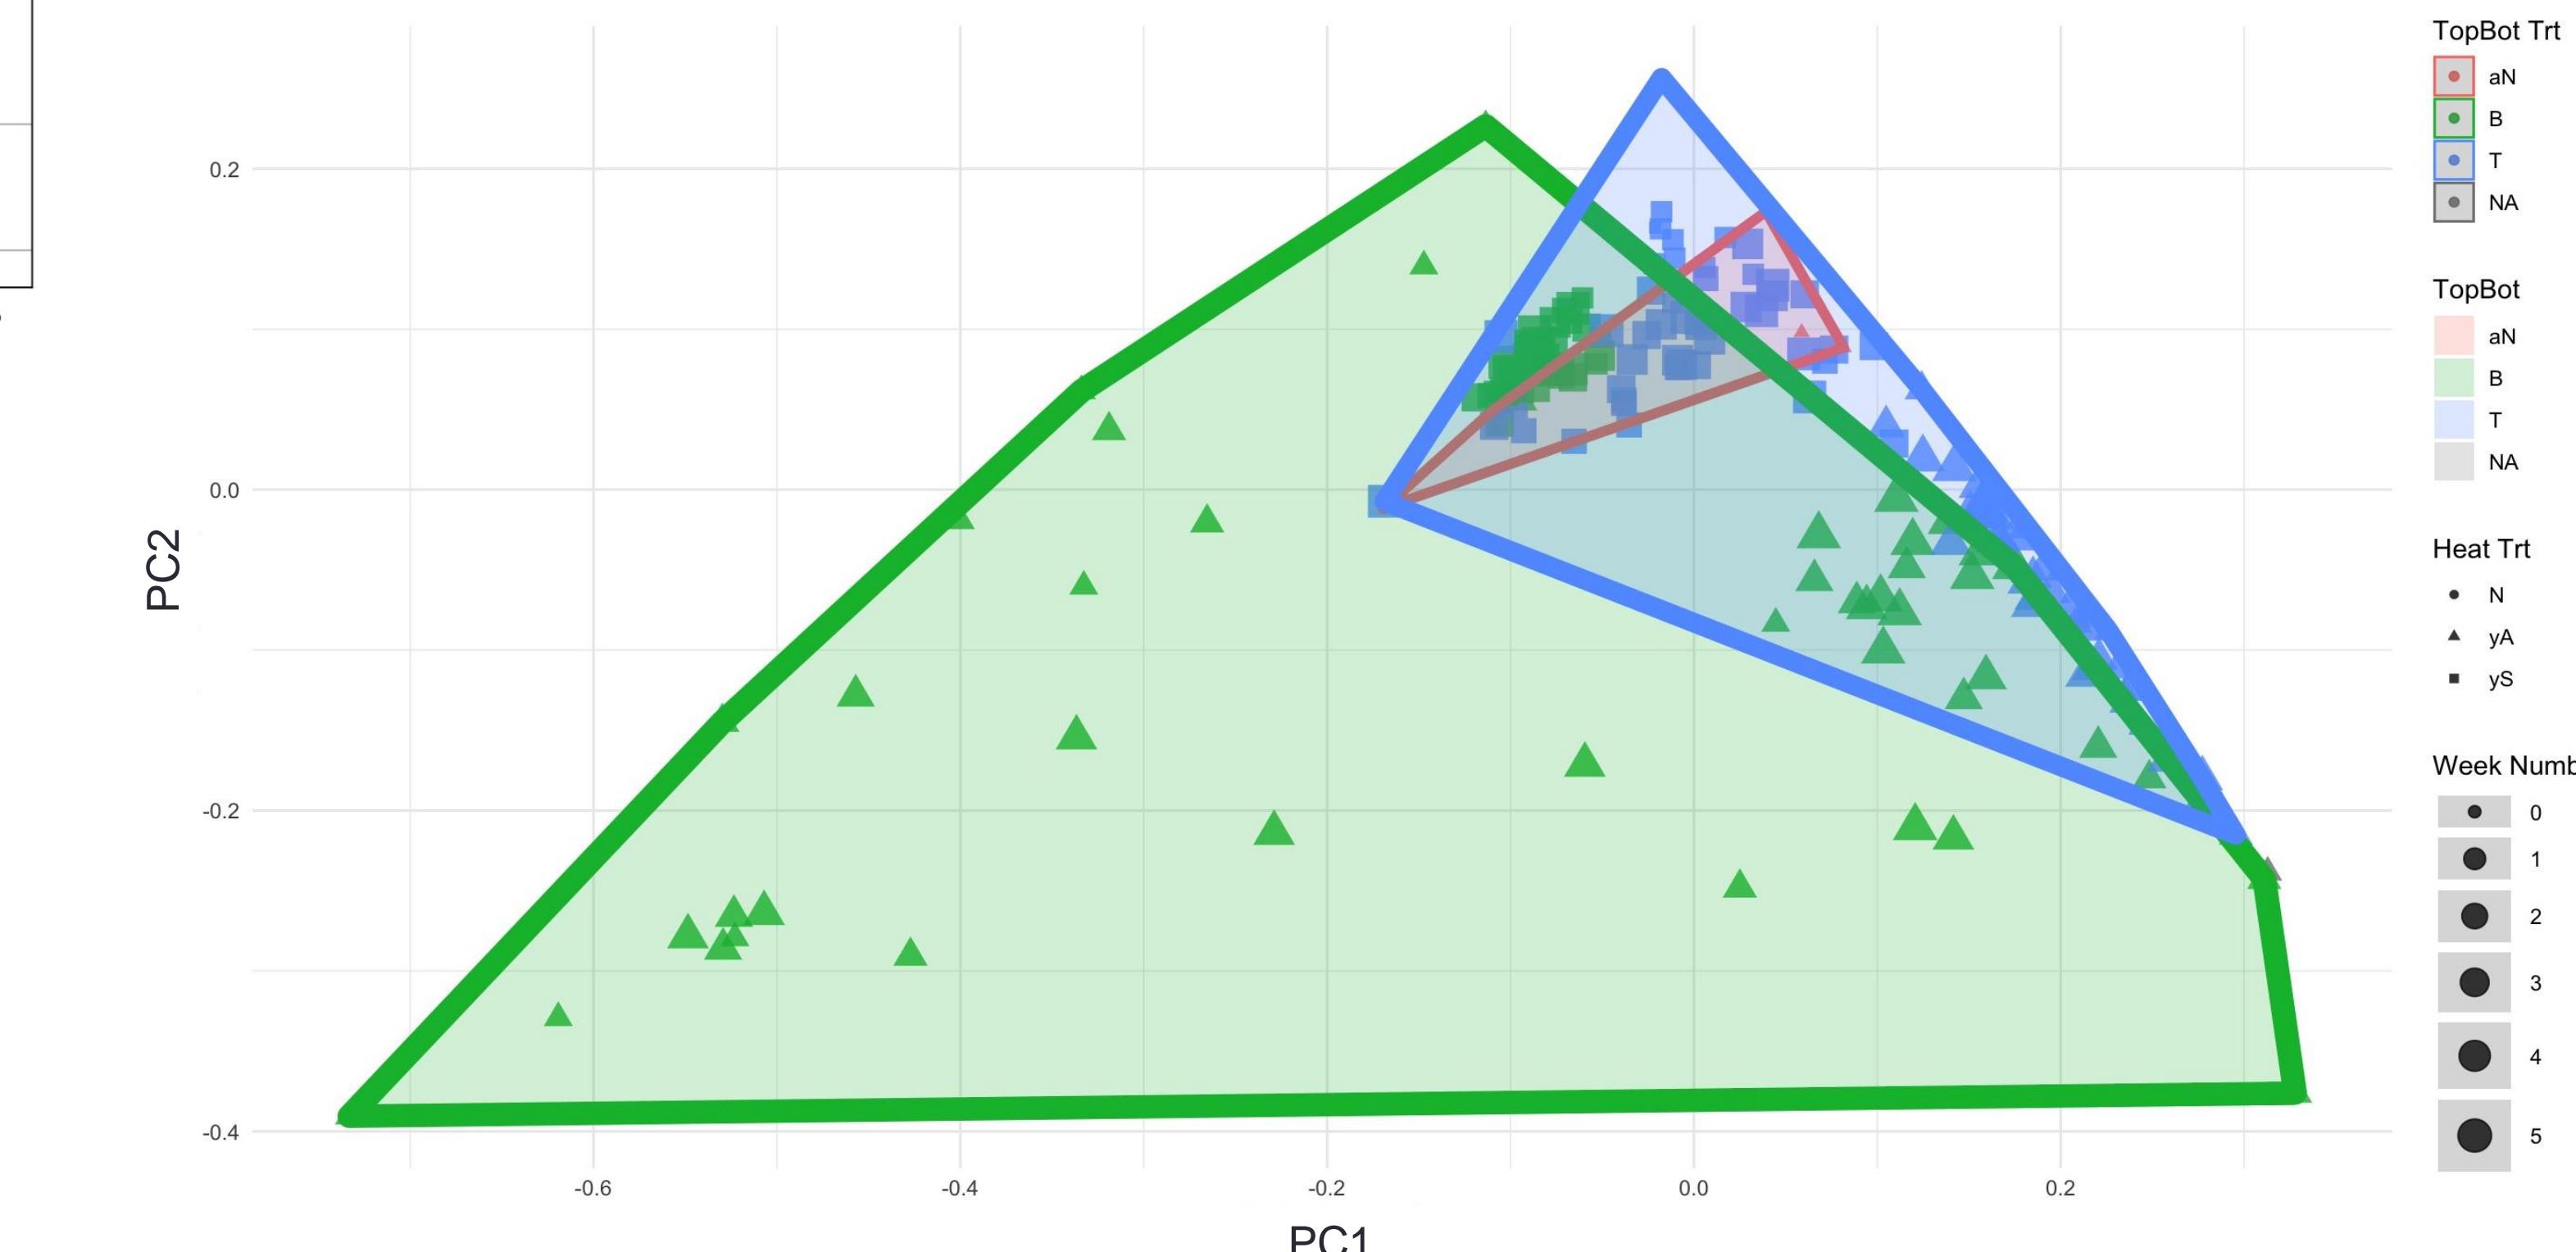

DNA concentration recovered faster in steamed pots.

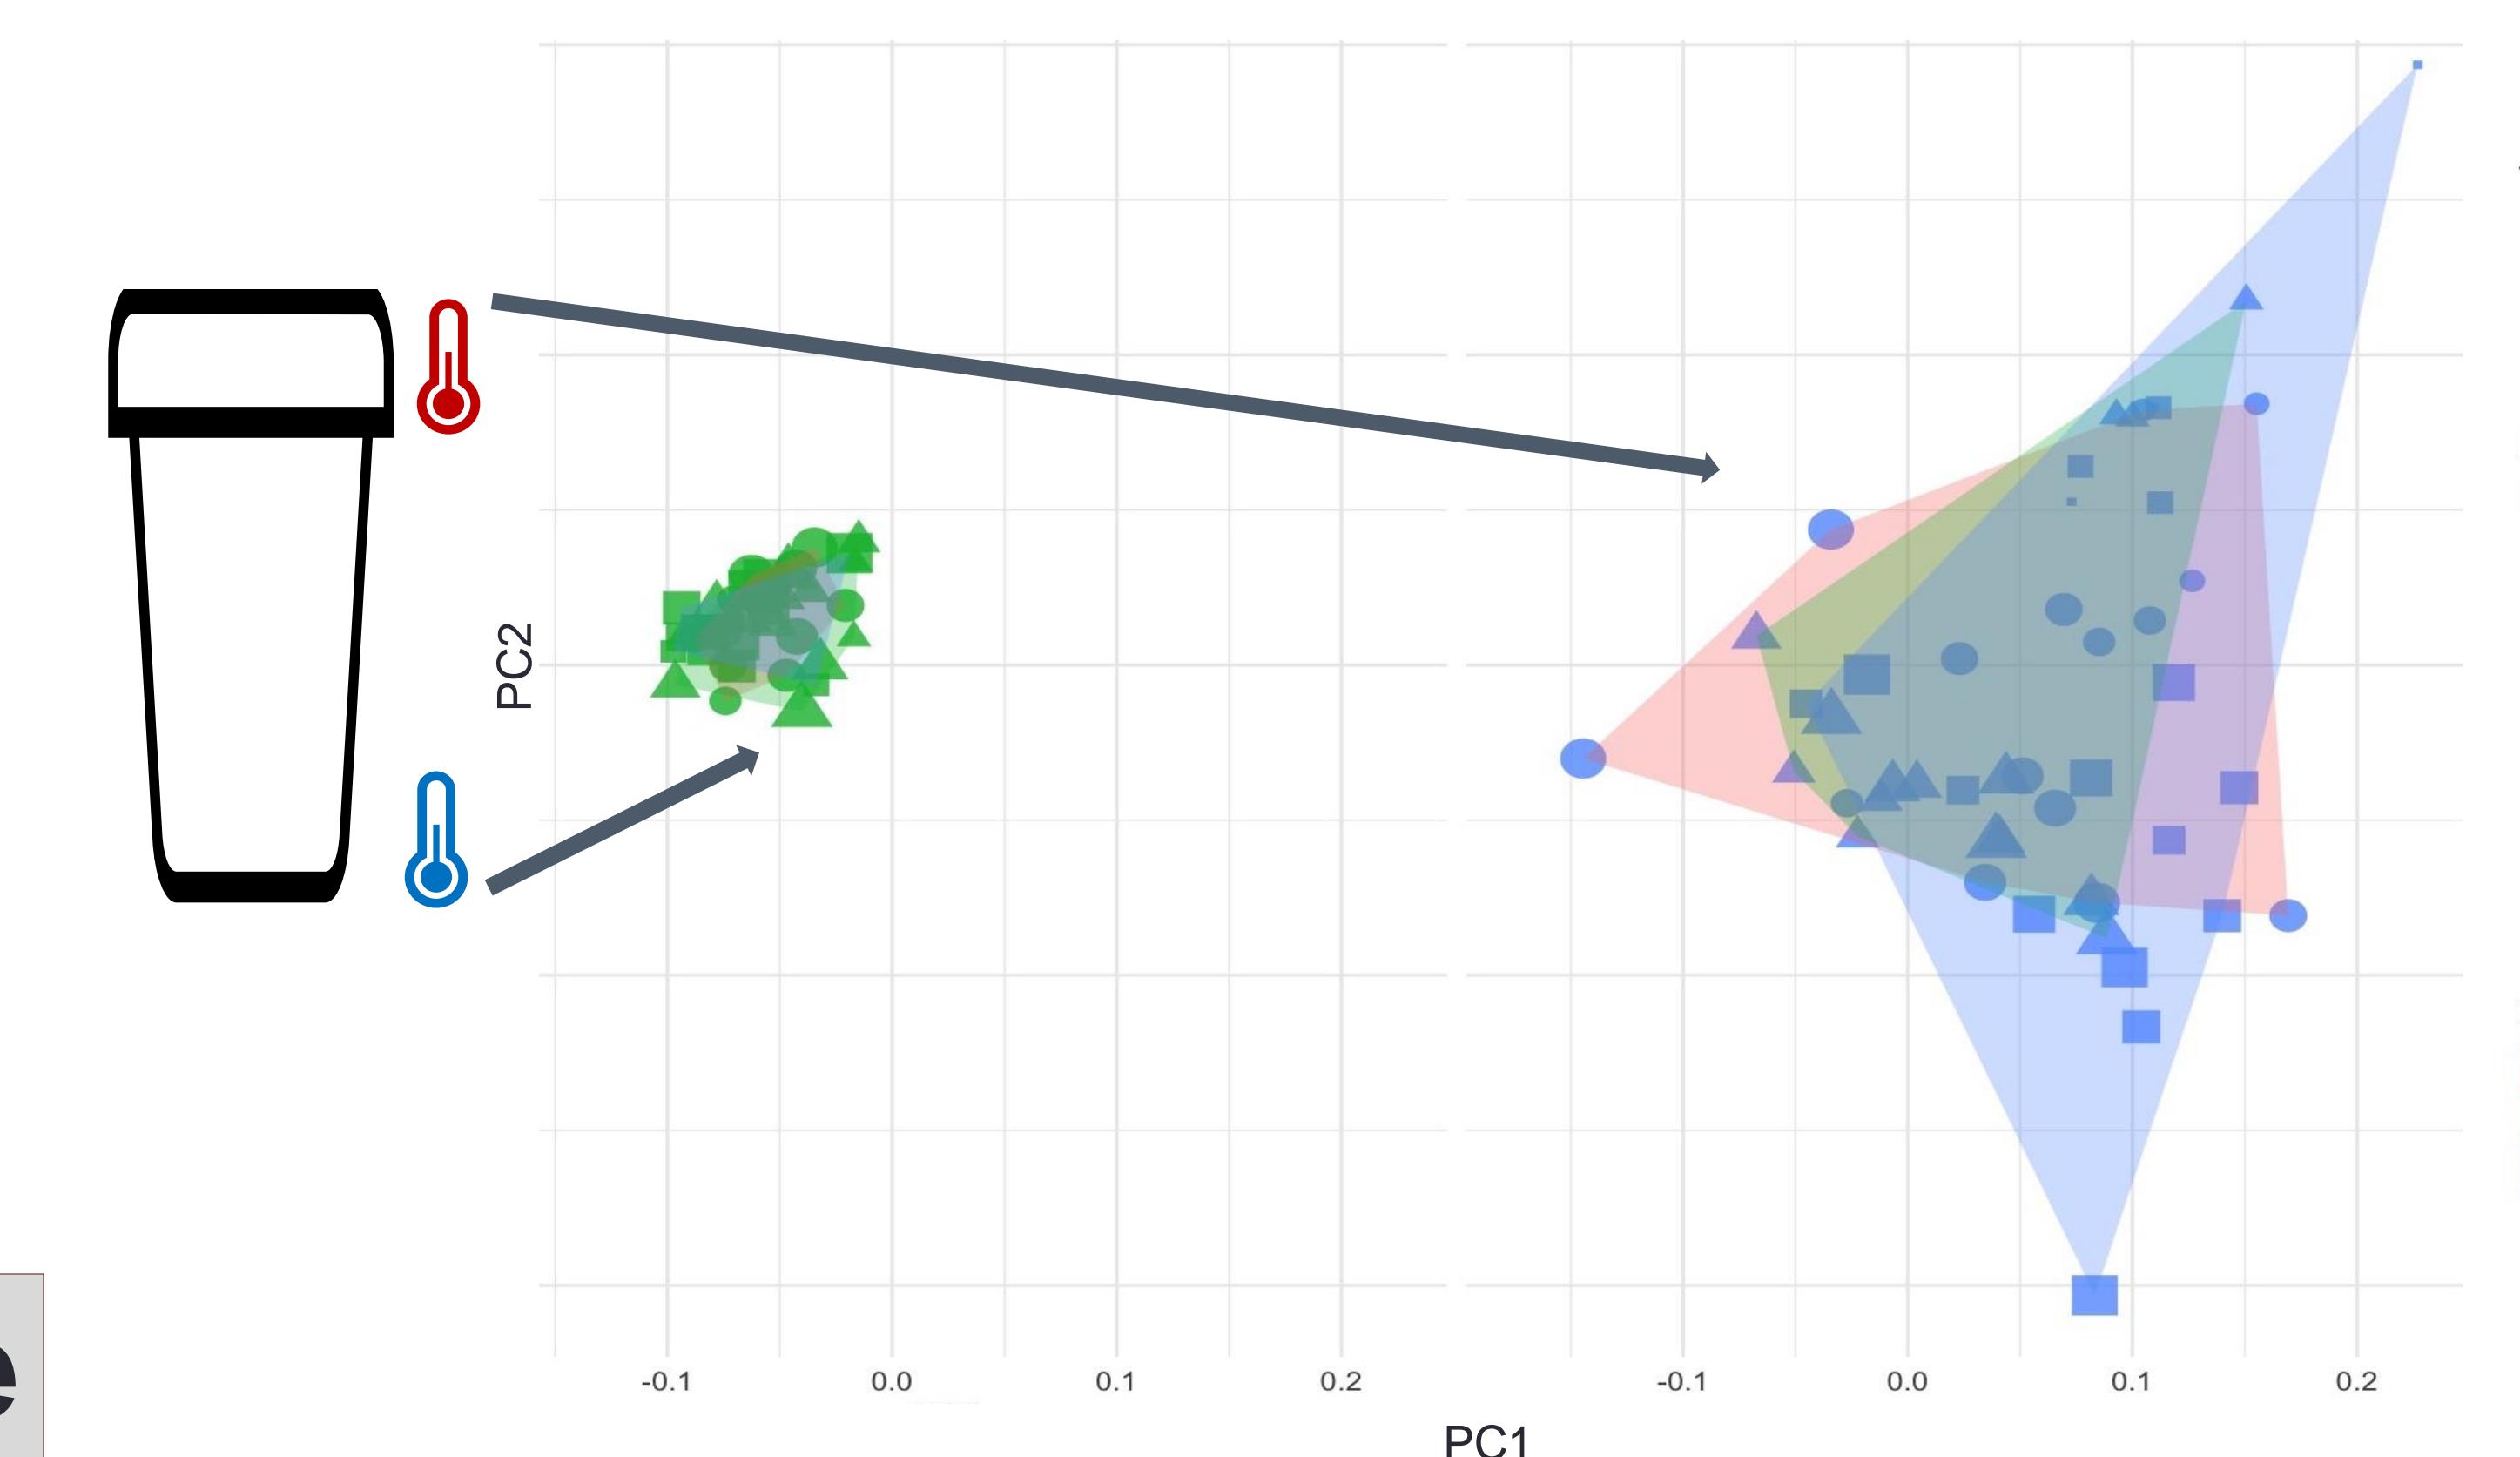

Autoclaving impacted microbiome composition more than steaming.

Plants may increase microbiome recovery in autoclaved samples.

Microbiomes were more resistant/resilient to steaming than autoclaving.
